As a contractor for the SwollenHippo company you have successfully completed several contracts and they believe you are ready to take on a difficult client. This client chose to hire a giraffe to perform some work for them, but unfortunately the distance between the giraffe's hoofs and their eyes made it difficult for them to complete the requested projects successfully. The result of their efforts is a number of items that have technical failures in them - ie errors.

Your task is to follow the prompts in the files that are available in the GitHub repo shared by the instructor of the course during class. Please note, there are **four files that exist in the repo**. Of those four, **one does NOT pertain to Ansible** and you **SHOULD use generative AI on it**.

The other three files have at least some content related to items not previously tested and you may **NOT** use Generative AI with them. All hosts used and referenced in this exam are running centOS as the operating system.

Please complete the Logging.sh portion of the exam first. Once this section is complete, close all instances of generative AI. Use after that section will be considered Academic Misconduct.

When complete, please upload all four files in separate txt documents to be graded.

Good luck, you will do awesome on this task!
